

# Polishing Using Ultra Fine Ceramics in a Micro Motor or Pendant Motor

Using a 2.35, 3.00 and even 1.6mm Diameter Ceramic stone they can be fitted directly into the collet on the Rotary handpiece.

The stone can then be shaped using a file to make a suitable shape with which you want to clean and polish.

Using fast speeds on your micro motor/pendant motor you can reach into very tight spaces and very quickly and effectively polish and clean.

The stones come in a range of grits which is ideal for coarse removal work to fine polishing.
